

Humanelektronik

has been specializing since 1995 in electromechanical and computer-based systems for people with physical disabilities. Our goal is to remove barriers in daily life in order to empower people with disabilities. Extensive consulting results in the development of practically-oriented individual solutions based on a broad product portfolio.

Effective communication with SeeTech®

New Generation Eye Control

Effective communication

Many people who are dependent on powerful computer-based communication aids want to keep working with the same software and be able to add modules to the system in line with their requirements.

SeeTech® has been developed on the basis of longstanding experience to fulfill this wish at low cost.

Convenient

SeeTech® Pro works very precisely and is extremely user-friendly. This eye control system has a large tolerance band, thus there is no need to recalibrate it constantly.

Flexible

SeeTech® Pro is built from modules to meet the user's specific needs and can be expanded without difficulty at any time. The communication software always stays the same.

New Generation

SeeTech® PRO is equipped with quick-access control buttons: for example, to instantly bring up the camera window in order to position the user correctly. Some of them can be programmed to individual needs: to calibrate the device or to start programs like the on-screen keyboard.

LEDs below the monitor allow constant assessment of the camera detection. An external emergency call connection or the use of an external switch are possible and the device is equipped with W-LAN.

An optional additional battery pack provides extra operating time if needed.

How SeeTech® Pro works

Indications

SeeTech® Pro is a powerful communication tool for people with ALS, multiple sclerosis, muscle weakness, locked-in syndrome, severe paraplegia or severe spasticity.

Interaction with the environment

Easy-to-learn communication software allows users to interact with their environments in many ways. If the software is operated with eye control, gazing at icons on the screen will cause a mouse click.

Various actions can be triggered in this way, for example:

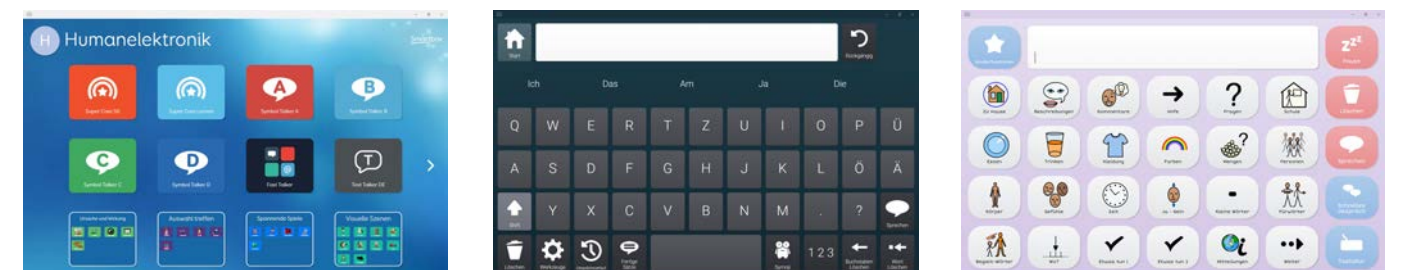

- Voice output of prepared messages
- Writing, storing and output of personal texts
- Control of the user's environment

Care providers operate the communication software via SeeTech®'s touch-sensitive screen.

Compact or Modular

SeeTech® Pro is available as an integrated solution, including communication software. However, existing communication devices can be upgraded with the SeeTech® ONLY eye control module. The communication software at hand simply continues in use. SeeTech® can be attached to a table, wheelchair or bed with mounts and stands. The modular concept offers individual solutions for every special need.
